

Introduction

- We will take you through successfully launching a rocket and landing it on a different body
- This is a simplified version based on our vast KSP knowledge

Jargon

Orbit When a one object is rotating around another object

Stable Orbit An orbit that does not decay untill it is no longer an orbit

Inclination How much the orbit differs from the parent body's plane.

delta-v

- aka: fuel budget
- how hard can i accelerate/decelerate my rocket
- dependent on:
 - fuel efficiency
 - thrust to weight ratio

Technicalities

Points on orbit

apoapsis : highest point on orbit

periapsis : Lowest point on orbit

| | | | |
|----------------------------|------|---------|--------|
| 1 | 2.10 | 278 m/s | 12.5 % |
| 2 | 2.07 | 322 m/s | 15.5 % |
| 3 | 2.04 | 380 m/s | 17.8 % |

2 x Z-400 Rechargeable Battery

Mass = 28 kg
Capacity = 400 e

2 x OX-STAT Photovoltaic Panel

Mass = 5 kg
Electricity = 8.75 w/s

Rockomax Brand Decoupler

Mass = 400 kg
Ejection Force = 250

3 x 120° LT-2 Landing Strut

Mass = 100 kg

Liquid Fuel = 1640 L

Decoupler = 1760 L

3 x Rockomax X200-32 Fuel Tank

Mass = 2 300 kg

Liquid Fuel = 1640 L

Decoupler = 1760 L

6 x 60° AV-R8 Winglet

Mass = 20 kg

Lift = 0.6

Deflection Range = 15°

Surface Area = 0.95

Rockomax „Mainsail“ Liquid Engine

Mass = 9 000 kg

Thrust = 1 500 000 N

SpI Latel = 280 s

SpI Vac = 330 s

Rockomax „Poodle“ Liquid Engine

Mass = 2 500 kg

Thrust = 220 000 N

SpI Vac = 390 s

Mk16-XL Parachute

Mass = 300 kg

Drag

- Stowed = 0.22

- Semi-Deployed = 1

- Deployed = 580

Mk1-2 Command Pod

Mass = 4 000 kg

Required Crew = 3

KERBAL X

The Kerbal X is one of the most successful rockets that can be ordered from a catalog. Despite the original design having been meant for a plastic model, it's proved itself quite dependable as a full-sized craft.

The X is capable of achieving orbit around Kerbin, and even features a very optimistic set of landing legs on its upper stage.

Staging

2 x Z-400 Rechargeable Battery

Mass = 28 kg
Capacity = 400 e

2 x OX-STAT Photovoltaic Panel

Mass = 5 kg
Electricity = 0.75 w/s

Rockomax Brand Decoupler

Mass = 400 kg
Explosion Force = 250

3 x 120° LT-Z Landing Strut

Mass = 100 kg

11500

How do we do it

- Split the rocket in 2 or more parts.
- Each part carries own fuel and engine
- Each part can be separated from the rocket in sequence
- e.g. booster stage, landing stage, transfer stage, ...

Total Δv (atm) = 5 404 m/s
Total Δv (vac) = 6 826 m/s
Total Mass = 131 390 kg
Part Count = 78
Total Cost = 64 820 σ

Mass = 1 000 kg
Thrust = 1500 000 N
Ign Latent = 280 s
Ign Incl = 330 s

successful

Why do we do it

- Rocket efficiency is inversely proportional to it's weight
- Delta-v goes up as total mass decreases
- We want to carry as little mass as possible
- Throw away excess weight of unused engines and empty fueltanks

Total Δv (atm) = 5 404 m/s
Total Δv (vac) = 6 826 m/s
Total Mass = 131 390 kg
Part Count = 78
Total Cost = 64 820 \square

Thrust = 1500 000 N
Isp (atm) = 280 s
Isp (vac) = 330 s

The X is capable of achieving orbit around
Kerbin, and even features a very optimistic set
of landing legs on its upper stage.

Staging

Staging

Gravity turn

Why do we turn

- going straight up gains altitude more quickly
- but we would just fall down again
- we need to move sideways too in order to achieve orbit

Gravity turn

Why to the east

- Rotation of earth is already moving us towards the east at 1.5km/h
- escape velocity of earth is just over 7km/s
- rotational velocity is higher around the equator that why we want to launch from Cape Canaveral
- 1.5km/h does not seem to be a lot compared to 7km/s but keep in mind that we are heaviest at the start of launch.

Launch

How do we do it

- throttle up
- point at the right angle
- don't. touch. anything. let gravity do it's work
- activate staging at the appropriate times
- keep apoapsis in front of you untill desired hight
- circularize orbit
- It easy, it's not ro... oh...

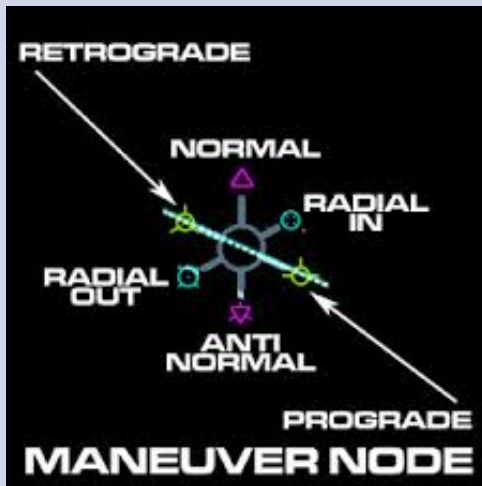

Low earth orbit

We are now almost in low earth orbit but still falling down. We need to circularize our orbit before we fall back. So we need to learn how to manipulate our orbit while in space.

Basis

Movement on an orbit always affect the oposite site of the orbit

Adjusting Orbits

Low Orbit

Maveuvering in space

- prograde** Along your movement vector, used to increase orbit altitude
- retrograde** Oposite your movement vector, used to decrease orbit altitude
- normal** Perpendicular to orbit, used to increase/decrease inclination
- anti-normal** perpendicular to orbit, used to increase/decrease inclination
- radial** Towards parent body, Used to shift orbit around
- anti-radial** Away from parent body, used to shift orbit around

Prograde

Normal

Radial
